Excel2OracleDB(*v.1.0.0*) User's Manual
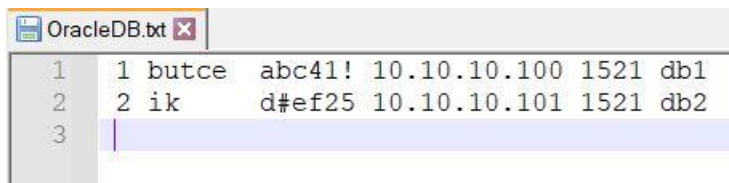

First of all, a text file must have been created to be referenced during the DB connection with

The **1**st column stands for the **row id** for the connection credentials

    2nd   **DB schema name**

    3rd   **DB connection password**

    4th   **port**

    5th   **DB alias**

such as

An **example implementation :**

The software inserts the datas, which are extracted from the file specified in the **Data source file** text field, into the table specified in the **Table name** text field. All existing tabs of the excel document will be scanned by toggling the **Import Data** button once, and the progress will be printed out to the darkgrey area.

⚠ Toggling the button without changing the current **Connection**, **Data source file** and **Table name** credentials will duplicate the data in the specified table.
